Description

This five-day course provides comprehensive training on considerations and practices to design a VMware NSX-T™ Data Center environment as part of a software-defined data center strategy. This course prepares the student with the skills to lead NSX-T Data Center design offered in the NSX-T Data Center 2.4 release, including design principles, processes, and frameworks. The student gains a deeper understanding of NSX-T Data Center architecture and how this can be leveraged to create solutions to address the customer's business needs.

Objectives

By the end of the course, you should be able to meet the following objectives:

- Understand and apply a design framework
- Apply a design process for gathering requirements, constraints, assumptions, and risks
- Analyze existing physical networking and security components, processes, and operations
- Design a VMware vSphere virtual data center to support NSX-T Data Center requirements
- Design a physical network to support network virtualization in a software-defined data center
- Design logical network services
- Design logical security services
- Design a data center rack solution to support scalability and high availability
- Analyze the operational readiness of an organization and perform a skills gap analysis
- Analyze alternative design choices for risk mitigation
- Understand the design and support for NSX-T Data Center infrastructure in a cloud implementation

Audience

- Experienced system administrators or network administrators

Prerequisites

- Good understanding of TCP/IP services
- Working experience with enterprise switching and routing
- Good understanding of network security and working experience with firewalls

It is recommended that you attend the following course:

- VMware NSX-T Data Center: Install, Configure, Manage[V2.x]
