# Veritas InfoScale Availability 7.3.1 for Windows: Administration

**CODE:**

VER\_ISA-7.3.1 A-W

**LENGTH:**

40 Hours (5 days)

**PRICE:**

Request Price

**Description**

The Veritas InfoScale Availability 7.3.1 for Windows: Administration course is designed for IT professionals tasked with installing, configuring, and maintaining the Veritas InfoScale Availability environments.

This course discusses how to use InfoScale Availability to manage applications for high availability. It provides you with the necessary fundamental skills that are required to manage a highly available application in a cluster, and also enables you to deploy InfoScale Availability in the lab environment to practically implement a sample cluster design and deployment.

**Objectives**

By the completion of this course, you will be able to:

- Describe how applications are managed in a high availability environment and the key requirements.
- Describe VCS architecture.
- Install InfoScale Enterprise (Availability and Storage)
- Manage applications under the control of VCS service groups.
- Manage resources within VCS service groups.
- Compare and contrast VCS configuration methods.
- Prepare and test applications before placing them under VCS control.
- Stop resources and manually migrate an application.
- Create a service group using online configuration tools.
- Configure notification using the NotifierMgr resource.
- Describe how VCS responds to resource faults.
- Control fault behavior using resource type attributes.
- Recover from resource faults, configure fault notification and triggers.
- Learn how to configure IMF.
- Describe how components communicate in a VCS environment.
- Describe how cluster application services work in a high availability environment.
- Describe how agents manage applications in a VCS environment.
- Describe how VCS manages Exchange Server, SQL Server and SharePoint Server in a clustered environment.
- Describe how VCS manages global cluster components.
- Describe how VCS handles intercluster communication failures in a global cluster.
- Configure the Global Cluster Option on a running cluster.
- Administer global cluster heartbeats

**Audience**

This course is for system administrators, system engineers, technical support personnel, network/SAN administrators, and systems integration/development staff, who will be installing, operating, managing, and working with InfoScale Availability.

**Prerequisites**

Knowledge of and hands-on experience with Microsoft Windows operating system administration is required. Working knowledge networking is also required.

**Programme**

High Availability and Clustering Concepts		
• High availability concepts		
• Clustering concepts		
• High availability application services		
Cluster Server Basics	• Clustering prerequisites	Labs: • Exercise A: Connecting to the virtual machines • Exercise B: Verifying network connectivity
VCS Building Blocks		
• VCS terminology	Labs:	
• Cluster communication	• Exercise A: Verifying the details of configured iSCSI disks	
• VCS architecture	• Exercise B: Performing a SORT pre-installation verification check	
Installing InfoScale		
• Introducing the Veritas InfoScale product suite		
• Installing InfoScale products		
		Labs: • Exercise A: Installing InfoScale Enterprise using the Veritas Product Installer (VPI) • Exercise B: Configuring the west cluster • Exercise C: Configuring the east cluster • Exercise D: Adding cluster systems to VIOM as managed hosts
VCS Operations		VCS Configuration Methods
• Common VCS tools and operations		• Starting and stopping VCS
• Service group operations		• Overview of configuration methods
• Resource operations		• Online configuration
		• Offline configuration
		• Controlling access to VCS
		Preparing Services for VCS
		• Preparing applications for VCS
		• Performing one-time configuration tasks
		• Testing the application service
		• Stopping and migrating an application service
Labs:		
• Exercise A: Starting and stopping VCS		
• Exercise B: Configuring automatic configuration backups		
• Exercise C: Configuring VCS stop options		
Labs:		
• Exercise A: Configuring storage for an application	Online Configuration	
• Exercise B: Configuring VMDg and MountV resources	• Online service group configuration	
• Exercise C: Recording MAC address of cluster nodes	• Adding resources	
• Exercise D: Setting up the application	• Solving common configuration errors	
• Exercise E: Manually migrating the application	• Testing the service group	
• Exercise F: Making the services offline	• Service group dependencies	
Labs:		
• Exercise A: Creating a service group		
• Exercise B: Adding NIC and IP resources		
• Exercise C: Adding VMDg, MountV, and Process resources to a service group	Offline Configuration	
• Exercise D: Linking all the resources in a service group	• Offline configuration procedures	
• Exercise E: Testing a service group	• Solving offline configuration problems	
• Exercise F: Setting resources to critical	• Testing the service group	
Labs:		
• Exercise A: Adding a resource using the command line interface	Configuring Notification	
• Exercise B: Testing the FileOnOff resource	• Notification overview	
	• Configuring notification	
	• Using triggers for notification	
Labs:		
• Exercise A: Configuring SNMP Trap Receiver		
• Exercise B: Configuring a NotifierMgr type resource on west cluster		
• Exercise C: Configuring a NotifierMgr type resource on east cluster		
• Exercise D: Testing notifications		
Handling Resource Faults		Cluster Server Additions
• VCS response to resource faults		
• Determining failover duration		
• Controlling fault behavior		
• Recovering from resource faults		
• Fault notification and event handling		
• Introducing Intelligent Resource Monitoring		
Cluster Communications		
• VCS communications overview		
• Cluster membership		
• Cluster interconnect configuration		
• Joining the cluster membership		
• Changing the interconnect configuration		
		Labs: • Exercise A: Verifying the low-priority LLT link communication in west cluster
System and Communication Faults		
• System failures		
• Cluster interconnect failures		
		Labs: • Exercise A: Observing VCS response to single LLT link failure • Exercise B: Observing VCS response to multiple LLT link failures (Jeopardy) • Exercise C: Observing VCS response to multiple LLT link failures (Network Partition)

## Clustering Applications

- Application service overview
- VCS Agents for managing applications
- The GenericService agent

Cluster Server Applications • The ServiceMonitor agent

Labs:

Lab 13a:

- Exercise A: Configuring shared storage for a GenericService resource

Lab 13b:

- Exercise A: Creating a service group
- Exercise B: Adding NIC and IP resources
- Exercise C: Adding VMDg, MountV, and GenericService resources to a service group
- Exercise D: Linking all the resources in service group websg
- Exercise E: Testing the service group
- Exercise F: Setting resources to critical

Clustering Exchange Server

- Exchange Server in the VCS environment
- VCS agent for Exchange Server
- Supported Exchange Server configurations
- Installing Exchange Server
- Configuring an Exchange Server service group

Labs:

- Exercise A: Configuring storage for Exchange application
- Exercise B: Configuring an Exchange Server service group

Clustering SQL Server

- SQL Server in the VCS environment
- VCS database agents for SQL Server
- Managing registry keys
- Installing SQL Server in the cluster
- Configuring a SQL Server service group
- Monitoring databases

Labs:

- Exercise A: Configuring storage for SQL application
- Exercise B: Configuring a SQL Server service group
- Exercise C: Testing the service group

Clustering SharePoint Server

- SharePoint Server in the VCS environment
- VCS agent for SharePoint Server
- Installing SharePoint Server in a clustered environment
- Configuring SharePoint Server service groups
- Verifying the SharePoint cluster configuration

Labs:

- Exercise A: Configuring a SharePoint Server farm
- Exercise B: Configuring a SharePoint Server service group

Global Cluster Architecture and Concepts

- Global cluster architecture
- Global cluster components
- VCS features for global cluster management

Labs:

- Exercise A: Verifying the lab environment for global clustering
- Exercise B: Configuring a local service group on west cluster
- Exercise C: Configuring a local service group on east cluster

Global Cluster Option • Inter-cluster communication failure

Labs:

- Exercise A: Configuring GCO on west and east cluster

Configuring a Global Cluster

- Exercise B: Linking clusters

- Configuring the Global Cluster Option
- Linking clusters
- Configuring a global service group
- Managing dynamic DNS updates

- Exercise C: Verifying DNS server access from cluster systems
- Exercise D: Reconfiguring vcshelper user account on east cluster
- Exercise E: Configuring a global service group on west cluster
- Exercise F: Configuring a global service group on east cluster

Managing a Global Cluster

Labs:

- Managing clusters in a global cluster environment
- Managing global cluster heartbeats
- Managing global service groups

- Exercise A: Testing dynamic DNS updates

- Exercise B: Adding another lcmp heartbeat link

Notification and Failover behavior in a Global Cluster

Labs:

- Notification in a global cluster
  - Failover behavior of a global service group
  - Cluster state transitions
- Exercise A: Verifying notification configuration
  - Exercise B: Testing local failover
  - Exercise C: Testing intercluster failover with ClusterFailOverPolicy set to Manual
  - Exercise D: Testing intercluster failover with ClusterFailOverPolicy set to Connected
  - Exercise E: Testing intercluster failover with ClusterFailOverPolicy set to Auto
